COSTLY SHOOTING.

Six Hundred and Fifty Dollars a Piece.

The up-to-date man and woman talk giltly of fortifications, but there is no more talk about a wart in a quarter of a minute than there is in a quarter of a century in the United States. The building of forts is a machine, running from the smallest to the greatest, and the war is the money. The man who builds a fort, buys a cannon, and a box of cartridges is looked upon as the first of the patriotic. The war is a game to him, and he is ready to pay any price for the privilege of playing. The war is a business, and the man who builds a fort is the banker of the war.

A New Jersey gentleman, who is a great supporter of the Union, has been in Washington for some time, and he has been telling me that the war is costing the country a fortune. He says that the war is a scheme to make money for the government, and he is willing to pay any price for the privilege of being associated with it. He says that the war is a scheme to make money for the government, and he is willing to pay any price for the privilege of being associated with it.

there is a great deal of work in the air and the subject of mails of all kinds is being discussed, most of the friends of the line will be delighted to know that no mail will be a misfortune. A submarine mine is reported to be torpedoed. It may be captured or placed at the bottom of the channel. The ship is reported to have been exploded by electricity at the direction of an engineer. The mine may be charged with gunpowder, gun cotton, dynamite or other nitro-glycerin explosives. It has been proved that dynamite is the most effective explosive for use in water, since it is not affected by heat or cold, detonation does not occur, and the explosion is not affected by the absence of any necessary depth of twenty-five or thirty feet below the ship’s bottom. A charge of dynamite may be used to destroy a vessel directly overhead.

The submarine mine is exploded by the engineer. The engineer takes the charge of the mine and places it in the water. The engineer then operates a machine which detonates the dynamite. The engineer is able to control the timing of the explosion. He may set the time to occur at any time after the mine is placed in the water. The engineer may also control the location of the explosion, since the mine is able to be placed at any location in the water.

The engineer operates the machine with electricity. The engineer can control the timing of the explosion by setting the time. He can also control the location of the explosion by placing the mine in the desired location. The engineer is able to operate the machine from a distance, since the machine is able to be operated remotely.

The submarine mine is the most effective weapon for use in war. It is a weapon that is able to be used at any time. The engineer is able to control the timing of the explosion, since the mine is able to be placed in the water at any time. The engineer can also control the location of the explosion, since the mine is able to be placed at any location in the water. The submarine mine is a weapon that is able to be used at any time and at any location in the water.

The engineer controls the timing of the explosion by setting the time. He can also control the location of the explosion by placing the mine in the desired location. The engineer is able to operate the machine from a distance, since the machine is able to be operated remotely.

The submarine mine is the most effective weapon for use in war. It is a weapon that is able to be used at any time. The engineer is able to control the timing of the explosion, since the mine is able to be placed in the water at any time. The engineer can also control the location of the explosion, since the mine is able to be placed at any location in the water. The submarine mine is a weapon that is able to be used at any time and at any location in the water.
