Symptoms have been induced in a dog taken for hydrophobia. Similar cases of rabies have been observed. It has been in the dog world a long time. I know, of course, that a dog can have rabies, but it is not common.

Recently, Dr. J. H. Webster, a well-known veterinarian, examined a dog that was suspected of having hydrophobia. He noticed peculiar symptoms, such as twitching and convulsions, and believed the dog was suffering from rabies. The dog was isolated immediately, and Dr. Webster administered treatment to prevent the spread of the disease.

The dog was under close observation, and it was determined that it had contracted rabies from another infected dog. The infected dog had been in contact with a wild animal, possibly a fox or a wolf, that was known to have rabies.

The dog was given injections of a special vaccine, and it was placed in quarantine. After several weeks, the dog showed signs of improvement, and it was released from quarantine. However, it is recommended that infected dogs be euthanized to prevent the spread of the disease.

Dr. Webster also emphasized the importance of vaccination in preventing rabies. He recommended that all dogs be vaccinated, and that the vaccinations be repeated every year. This would help prevent the spread of the disease and protect the health of the pets and their owners.

In conclusion, rabies is a serious disease that can be prevented. It is important to vaccinate pets and to isolate and euthanize infected animals to prevent the spread of the disease. With proper care and attention, pets can enjoy a healthy and happy life.
A. M. McCorkle, who died a week ago, that it was Noah Webster, Shoals, funeral services being conducted by R. W. Ansley and J. A. Stroud.
